Example Application

Advertisement Counter

Advertisement Counter

- **Lower-bound invariant**
Advertisements are paid according to a minimum number of impressions
- **Clients will go offline**
Clients have limited connectivity and the system still needs to make progress while clients are offline
- **No lost updates**
All displayed advertisements should be accounted for, with no lost updates

Advertisement Counter Losing Updates

Incorrect value
is computed
because of
incompatible lattice.

Advertisement Counter Application Flow

Client
reads state
from the server.

Client
locally mutates
state.

Client
pushes changes
back to
the server.

Server
enforces invariants
over state.

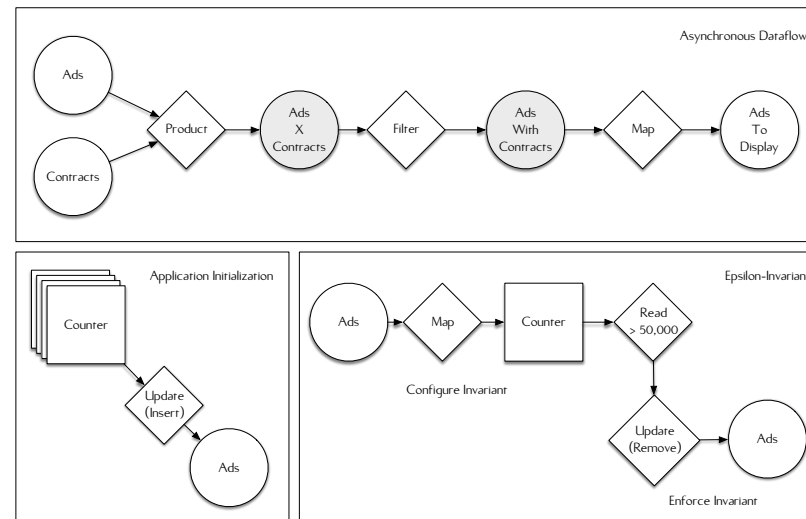

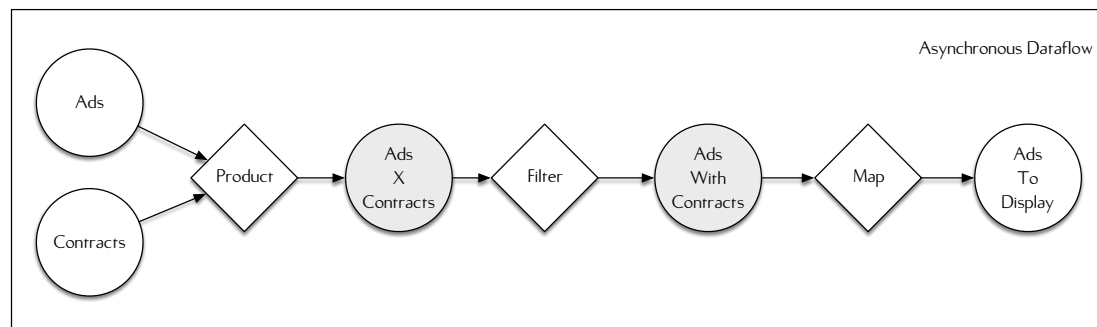

Client retrieves
updated state
periodically.

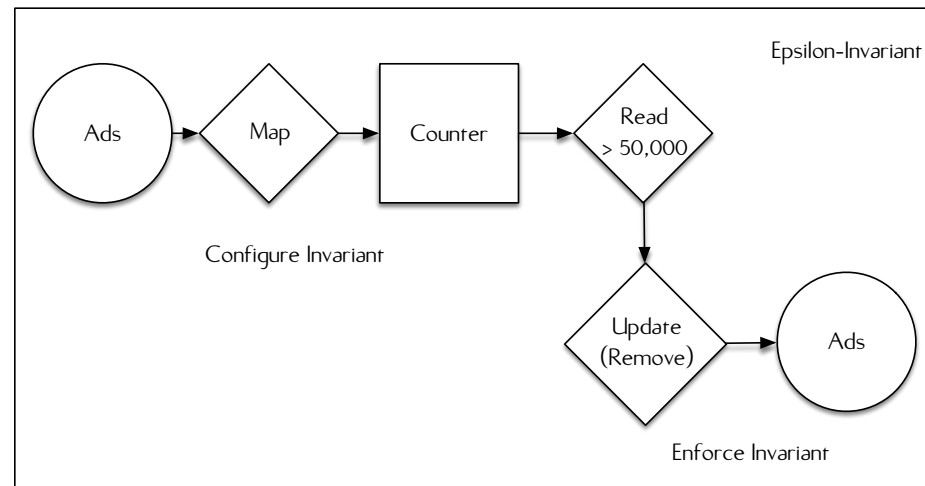

Clients
unable to communicate
may
violate invariant.

Advertisement Counter Application Design

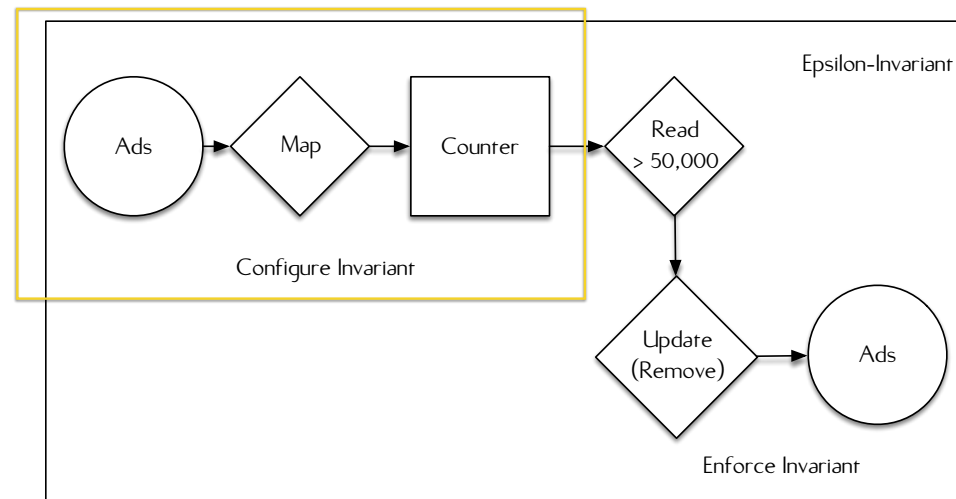

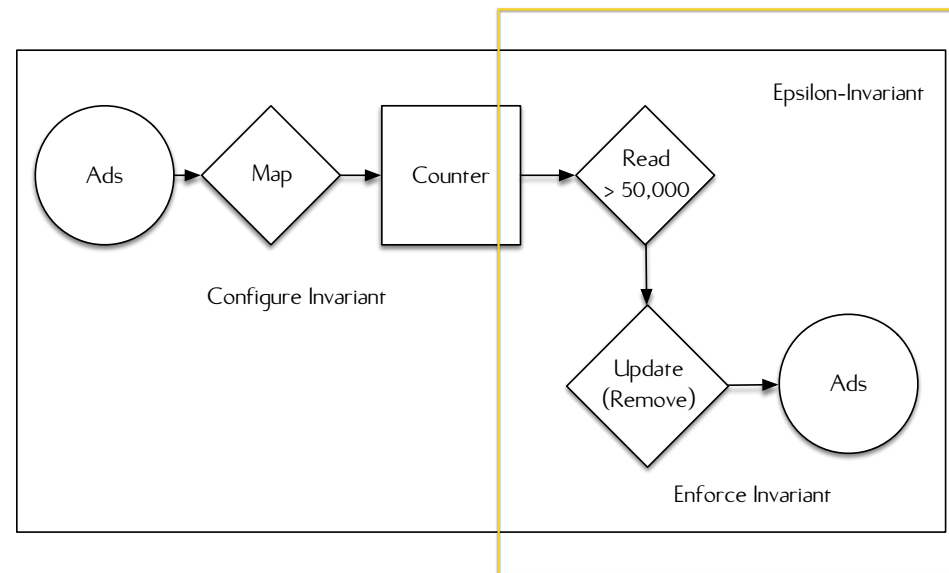

Configure
invariants
for all of the
advertisements.

**Remove the
advertisement from
the list.**

Advertisement Counter

- **Completely monotonic**
Disabling advertisements and contracts are all modeled through monotonic state growth
- **Arbitrary distribution**
Use of convergent data structures allows computational graph to be arbitrarily distributed
- **Divergence**
Divergence is a factor of synchronization period, concurrency, and throughput rate
